- 782. Dr. Nicolàu J. Moreira. Rio de Janeiro. BORBOLETA SERIGENICA,**
(a sort of Butterfly which produces silk.) (*Attacus Aurota*
Lepidopterous).

Common name, Butterfly, “*Porta Espelhos*.”

Class,	Insects.
Order,	Lepidopterous.
Family,	Nosturnas.
Section,	Bombycianous.
Genus,	Attacus.
Subgenus,	Saturnia.
Species,	Aurota.

NOTE.—This Butterfly abounds in almost all the Empire of Brazil. It produces during each generation about 240 cocoons of silk; each cocoon weighing $2\frac{1}{2}$ drachms, and producing 30 grains of fine silk. The fibre of a yellowish colour, is strong elastic, and long, a single thread sustains a weight of 4 drachms, and a cord of 24 threads resists the weight of $\frac{3}{4}$ of a pound. The “Larva” of this insect subsists on the leaves of “*Mamona*” (Bot. *Ricinus*), of Beribà (Bot. *Anona*) and principally on the “Cajazeiro” (Bot. *Spondias*.)

The great advantage in the cultivation of this Lepidopterous consists that the Butterfly enclosed in the cocoon can be preserved and utilized without breaking the fibre.
